

### **ESS302 Applied Geophysics II**

Gravity, Magnetic, Electrical, Electromagnetic and Well Logging

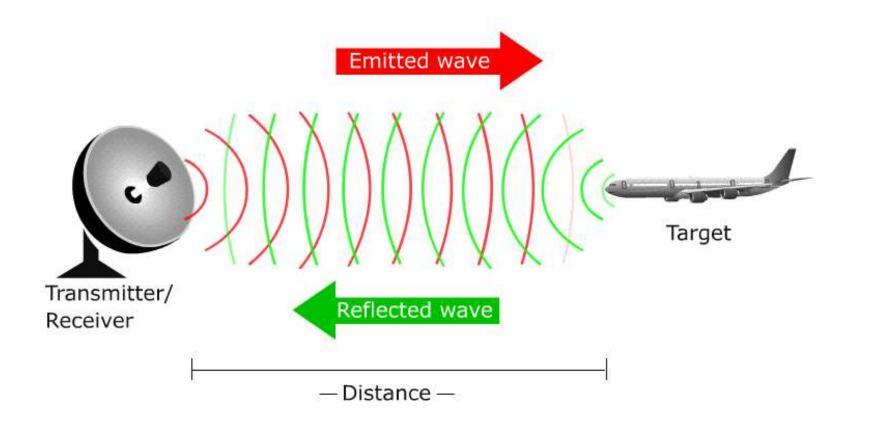

**Electromagnetic 1: GPR Theory** 

Instructor: Dikun Yang Feb – May, 2019

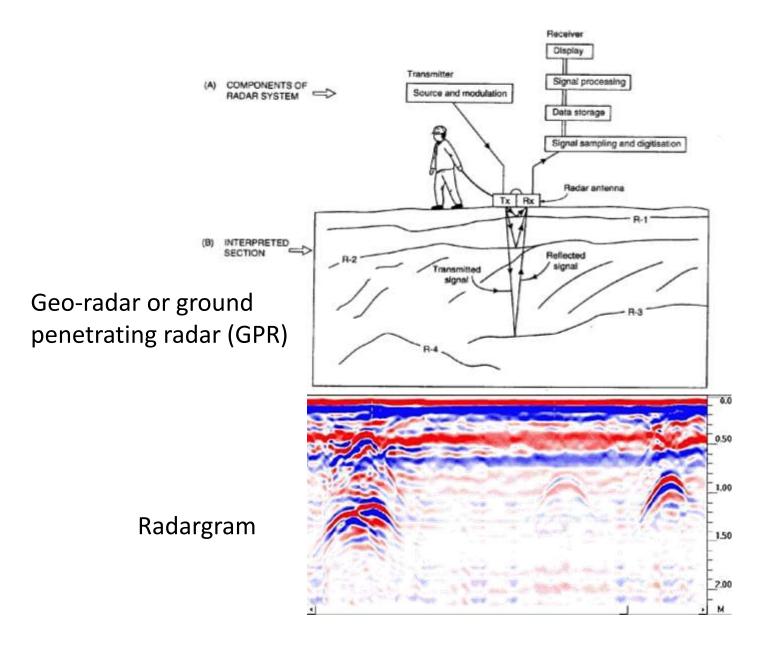

#### Radar

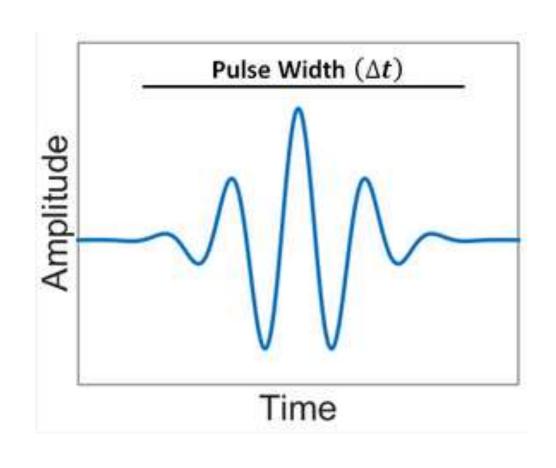

- Can we do the same thing to the subsurface?
- What are the differences between finding an object in the air and underground using EM waves?

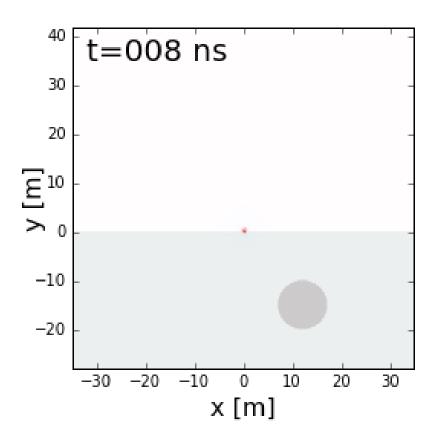

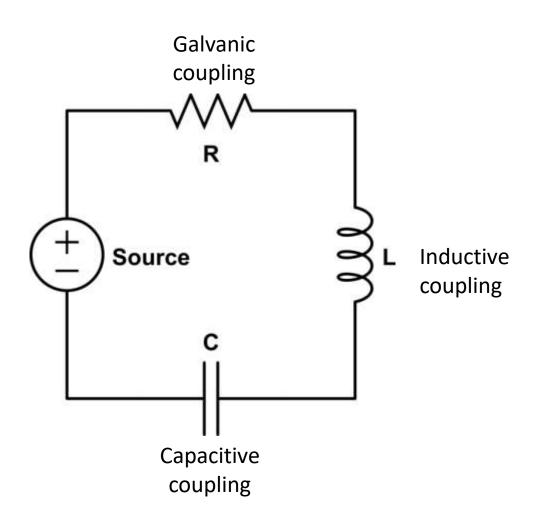

## EM Field at High Frequencies – Wave

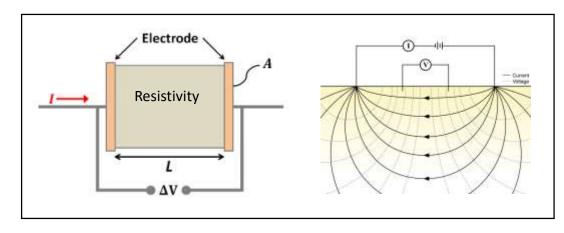

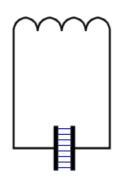

# Ground Penetrating Radar (GPR)

#### Recall...

#### **Capacitive coupling**

- High frequency EM field
- Dielectric constant  $(\varepsilon_r)$
- Wave phenomenon

## Wave Propagation

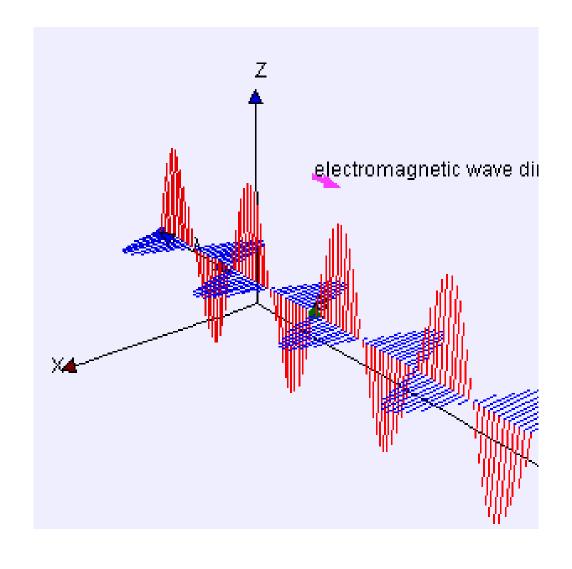

Medium characterized by three physical properties:  $\sigma$  (electrical conductivity),  $\varepsilon$  (electrical permittivity),  $\mu$  (magnetic permeability)

$$V = \sqrt{rac{2}{\muarepsilon}} \left[ \left( 1 + \left( rac{\sigma}{\omegaarepsilon} 
ight)^2 
ight)^{1/2} \ + 1 \, 
ight]^{-1/2}$$

Wave regime 
$$V=rac{1}{\sqrt{\mu arepsilon}}=rac{c}{\sqrt{\mu_r arepsilon_r}}$$

Non-magnetic approximation  $(\mu_r = 1)$ :

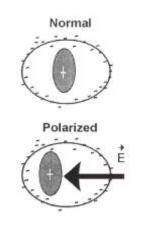

$$V=rac{c}{\sqrt{arepsilon_r}}$$

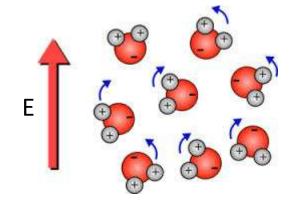

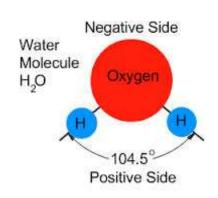

Question: How does EM wave propagate in perfect conductors?

#### **Dielectric Permittivity (ε):**

How easily a material is electrically polarized

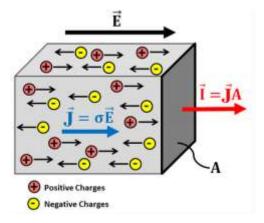

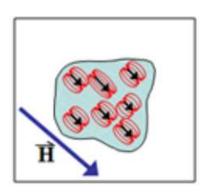

#### Electrical Conductivity ( $\sigma$ ):

How easily electrical charges flow through a material

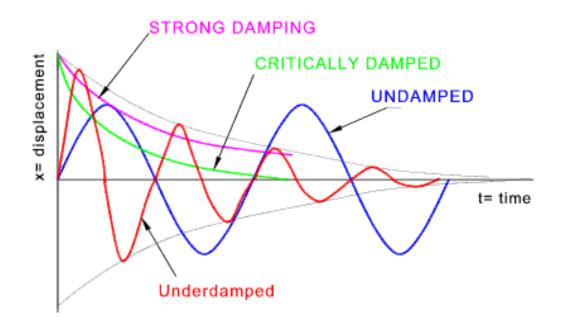

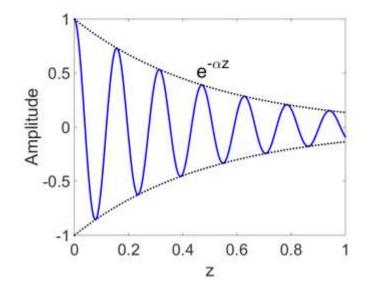

#### **Magnetic Permeability (μ):**

How strongly a material supports magnetism

#### Wave Attenuation

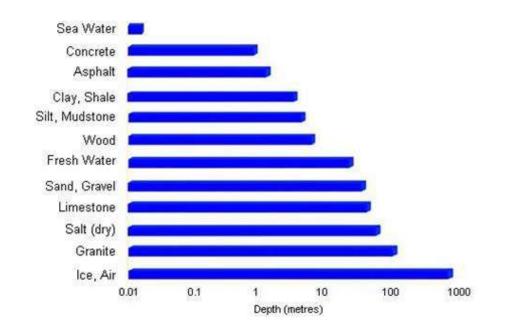

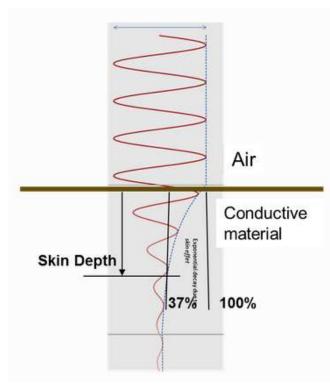

$$lpha = \omega \sqrt{rac{\mu arepsilon}{2}} \left[ \left( 1 + \left( rac{\sigma}{\omega arepsilon} 
ight)^2 
ight)^{1/2} - 1 
ight]^{1/2} pprox \left\{ egin{align*} \sqrt{rac{\omega \mu \sigma}{2}} & ext{for } \omega arepsilon \ll arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \sigma \ll \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \sigma \ll \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ll \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ll \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ll \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ll \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ll \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ll \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ll \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ll \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ll \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ll \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ll \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ll \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ rac{\sigma}{2} \sqrt{rac{\mu}{arepsilon}} & ext{for } \omega arepsilon \ \ \omega = 0 \ \ \omega \ \ \ \ \omega \ \ \ \ \ \omega \ \ \ \ \ \ \ \ \ \ \$$

- Quasi-Static ( $\omega \epsilon << \sigma$ ): Conductive/Low-frequency
- Wave Regime ( $\sigma \ll \omega \epsilon$ ): Resistive/High-frequency

## Skin Depth and Probing Distance

- Skin Depth: Distance at which a wave is reduced to 37% (1/e) of its original amplitude
- The probing distance is approximated 3 skin depths.

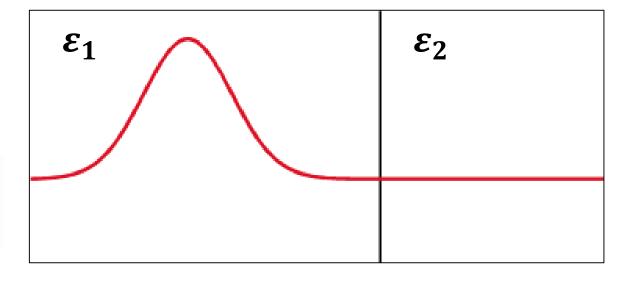

$$\delta pprox \left\{ egin{array}{ll} 503 \sqrt{\dfrac{1}{\sigma f}} & ext{ for } \omega arepsilon \ll \sigma \ \\ 0.0053 \dfrac{\sqrt{arepsilon_r}}{\sigma} & ext{ for } \sigma \ll \omega arepsilon \end{array} 
ight.$$

#### Table of relative dielectric permittivity ( $e_R$ ), electrical conductivity ( $\sigma$ ), and velocity.

Material	e <sub>R</sub>	σ(mSeimens/m)	V avg (m/ns)
Air	1	0	.3
Distilled water	80	0.01	0.033
Fresh water	80	0.5	0.033
Sea water	80	3000	0.01
Dry sand	<b>3</b> - 5	0.01	0.15
Saturated sand	20-30	0.1-1.0	0.06
Limestone	4-8	0.5-2.0	0.12
Shales	5-15	1-100	0.09
Silts	5-30	1-100	0.07
Clays	5-40	2- 1000	0.06
Granite	4-6	0.01-1.0	0.13
Dry salt	5-6	0.01-1.0	0.13
Ice	3-4	0.01	0.16

#### Reflection and Transmission

$$R = rac{ ext{Reflected Amplitude}}{ ext{Incident Amplitude}} = rac{\sqrt{arepsilon_1} - \sqrt{arepsilon_2}}{\sqrt{arepsilon_1} + \sqrt{arepsilon_2}}$$
  $T = rac{ ext{Transmitted Amplitude}}{ ext{Incident Amplitude}} = rac{2\sqrt{arepsilon_2}}{\sqrt{arepsilon_1} + \sqrt{arepsilon_2}}$ 

- If  $\varepsilon_1 \approx \varepsilon_2$ , most of the wave is transmitted
- If  $\varepsilon_1 \ll \varepsilon_2$  or  $\varepsilon_1 \gg \varepsilon_2$ , most of the wave is reflected

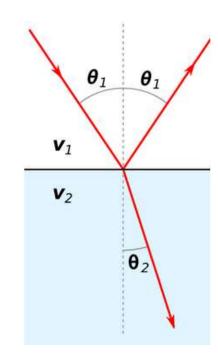

### Refraction

• Snell's Law:

$$rac{\sin\! heta_1}{V_1} = rac{\sin\! heta_2}{V_2}$$

$$V=c/\!\sqrt{arepsilon_r}$$

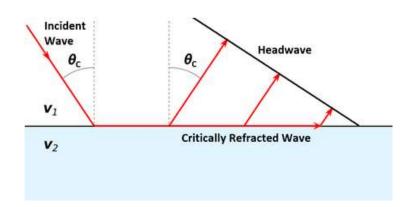

$$\sqrt{arepsilon_1} \sin\! heta_1 = \sqrt{arepsilon_2} \sin\! heta_2$$

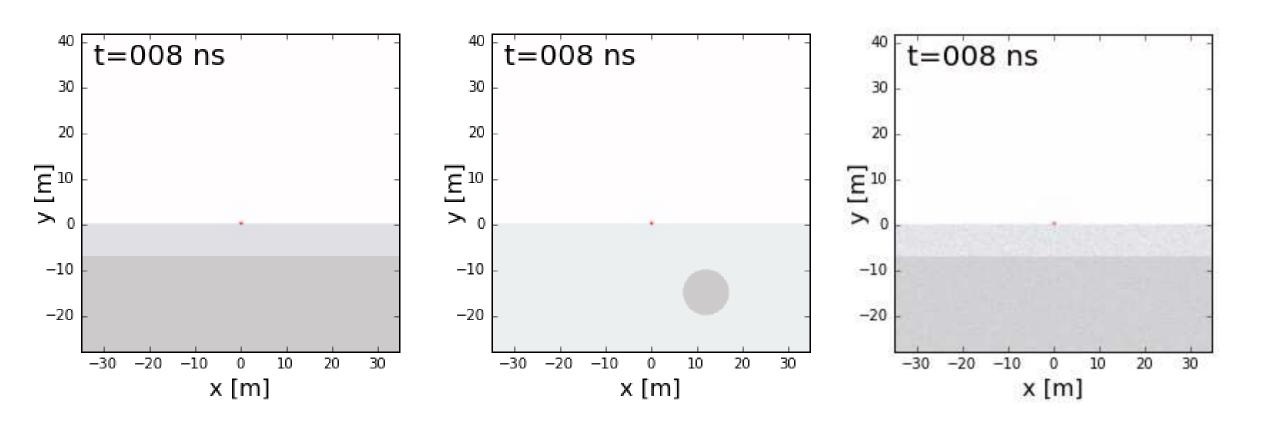

Critical refraction

$${
m sin} heta_c=rac{V_1}{V_2}$$

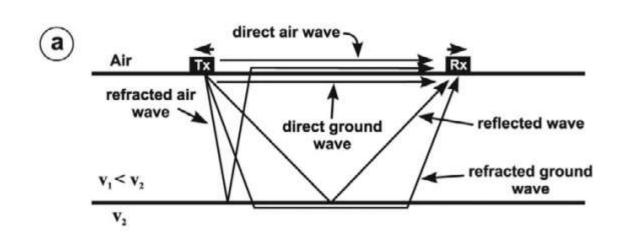

Requires  $V_1 < V_2$ 

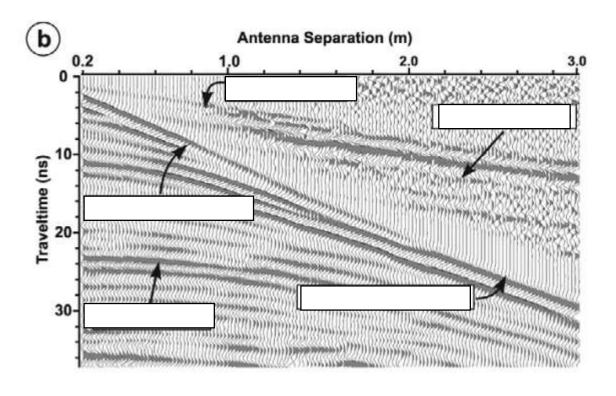

## Reflection, Transmission, Refraction, Scattering

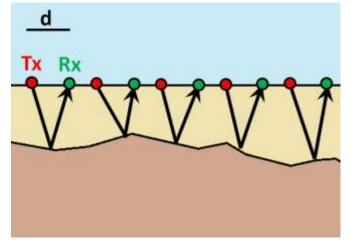

## EM Wave Propagation in a Two-layer Earth

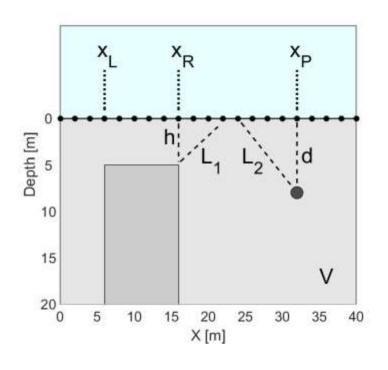

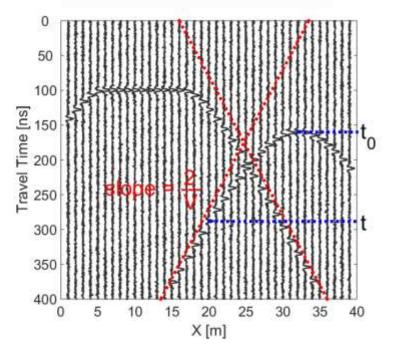

## GPR Anomaly on Radargram

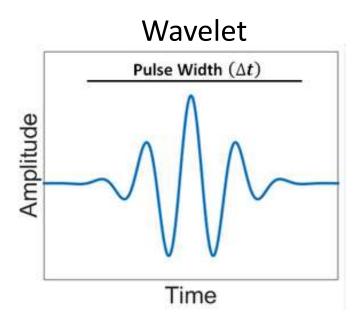

- Determine background medium velocity
- Determine the depth of burial
- Determine the size of extended objects

## **GPR Source Signal**

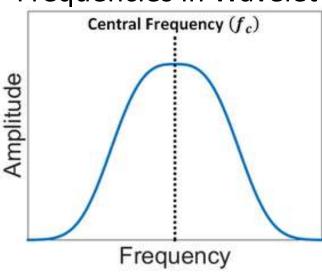

- Wavelet: A wave-like oscillation of short duration
- Bandwidth: Range of frequencies in the wavelet
- Pulse Width: Time-duration of wavelet
- Spatial Length: Wavelength of the wavelet
- Central Frequency: Operating frequency of GPR survey

$$f_c = rac{1}{\Delta t}$$

Typically 50 MHz to 1 GHz

#### Frequencies in Wavelet

## GPR Source Signal: Spatial Length

 The spatial length (wavelength) of the GPR pulse is dependent on the central frequency and velocity

$$\lambda = rac{V}{f_c} = rac{c}{f_c\sqrt{arepsilon_r}} = rac{c\,\Delta t}{\sqrt{arepsilon_r}}$$

 When the GPR signal at some frequency is transmitted across an interface, it can be stretched or contracted

Lower velocity

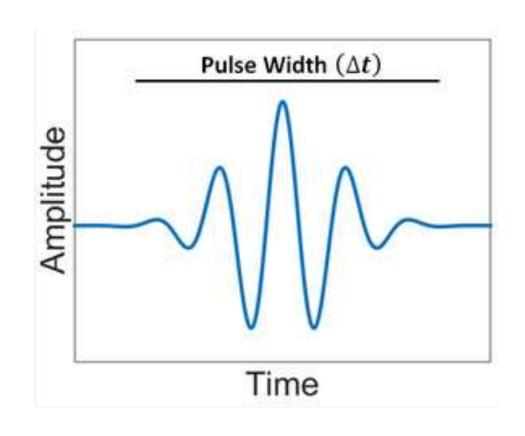

Shorter spatial length

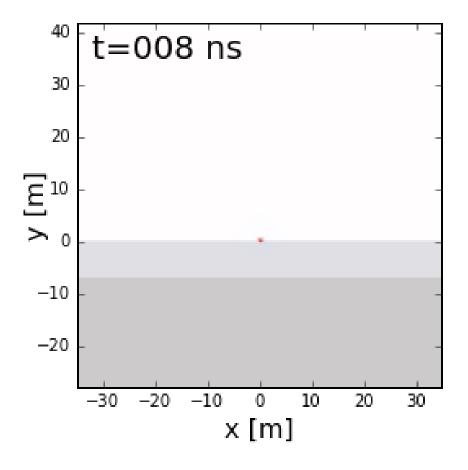

Lower frequency

Larger spatial length

## Signal Stretched or Contracted?

#### Resolution of GPR

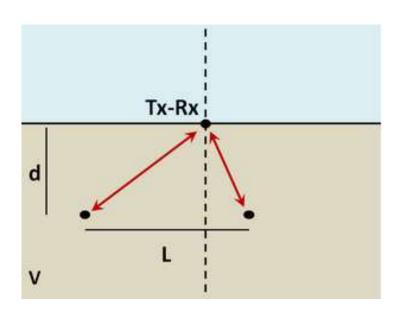

• ¼ wavelength rule:

The thickness of a layer must be at least ¼ the wavelength of the GPR signal.

$$L>rac{c}{4f_c\sqrt{arepsilon_r}}=rac{c\Delta t}{4\sqrt{arepsilon_r}}$$

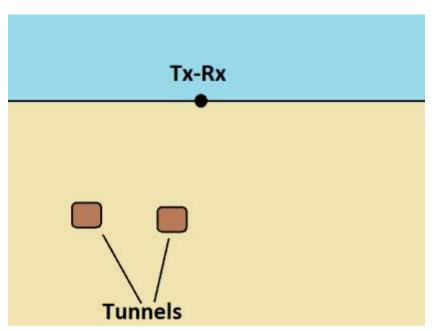

For zero offset survey

$$L>\sqrt{rac{V\,d}{2f_c}}$$

#### Probing Distance vs. Resolution

- Want to find two buried tunnels.
- Using a zero offset survey configuration.
- Higher frequencies give better resolution
- Lower frequencies give larger probing distance

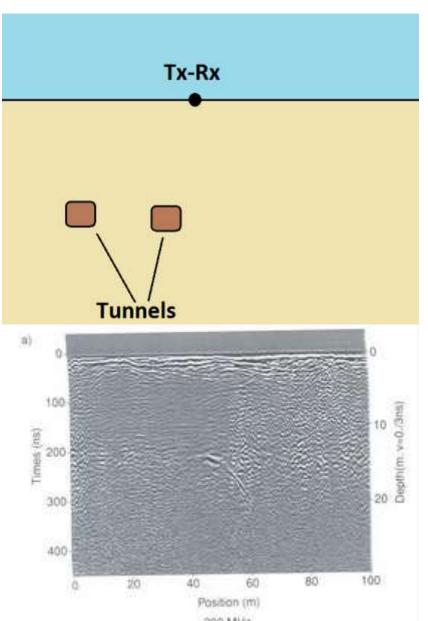

### Radargram 200 MHz

- Little to no useful signal after 200 ns
- Can't see features from the tunnels

- Too much attenuation of signal
- Probing distance insufficient

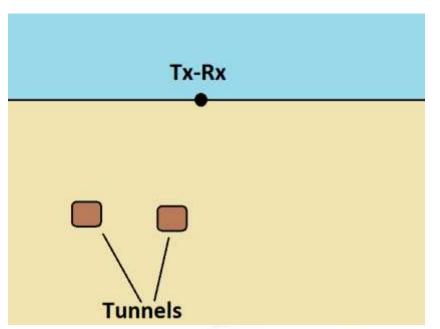

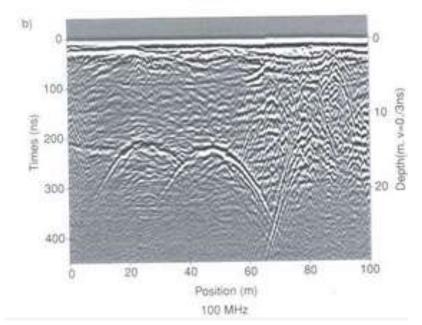

### Radargram 100 MHz

- Useful signals up to 300 ns
- See top of hyperbolas from tunnels

- Lower resolution
- Can see tunnels

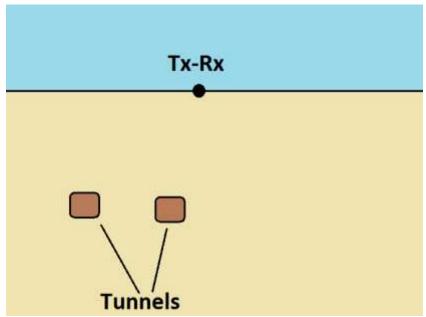

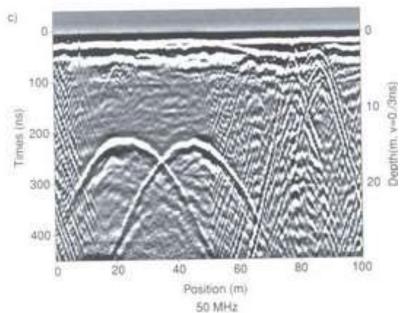

### Radargram 50 MHz

- Useful signals through 400 ns
- Well-defined hyperbolas from tunnels

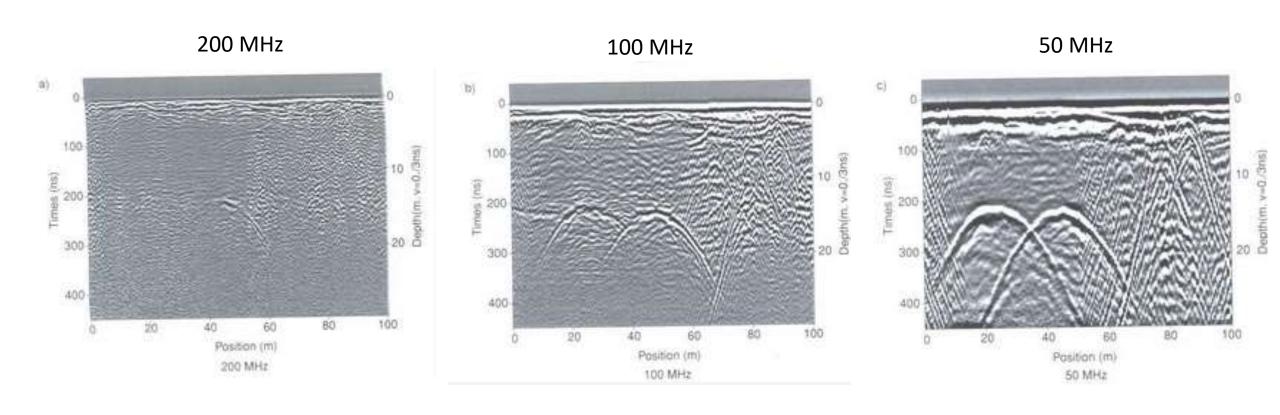

- Lower resolution image
- Best frequency for what we want to observe

# Depth vs. Resolution

## Summary

- EM at high frequency: Wave regime
- Physical properties utilized by EM/GPR
- Reflection, transmission, refraction and scattering
- Signal length scale and resolution
- Depth vs. spatial resolution
